

Step-1

a) The intersection of two planes through $(0,0,0)$ is probably a **line** but it could be a **subspace**. It can't be the zero vector \mathbf{Z} .

Step-2

b) The intersection of a plane through $(0,0,0)$ with a line through $(0,0,0)$ is probably $\{(0,0,0)\}$ but it could be a line itself if the line is in the plane and it could be a **subspace**.

Step-3

c) Let \mathbf{S} and \mathbf{T} be the subspaces of \mathbf{R}^5

Now we have to show that $\mathbf{S} \cap \mathbf{T}$ is also a subspace of \mathbf{R}^5 .

Step-4

First we verify that \mathbf{R}^5 is a vector space.

Let

$$x = (x_1, x_2, x_3, x_4, x_5) \\ y = (y_1, y_2, y_3, y_4, y_5) \in \mathbf{R}^5$$

And $r \in \mathbf{R}$

Now,

$$x + y = (x_1 + y_1, x_2 + y_2, x_3 + y_3, x_4 + y_4, x_5 + y_5) \in \mathbf{R}^5 \\ y + x = (y_1 + x_1, y_2 + x_2, y_3 + x_3, y_4 + x_4, y_5 + x_5) \in \mathbf{R}^5$$

1. Therefore, $x + y = y + x$ (since $x_1 + y_1 = y_1 + x_1, x_2 + y_2 = y_2 + x_2$

The addition is commutative in \mathbf{R})

2. since addition in \mathbf{R} is associative

Therefore if $x, y, z \in \mathbf{R}^5$ then $x + (y + z) = (x + y) + z$

3. $0 = (0, 0, 0, 0, 0)$

$$\begin{aligned}
 x + 0 &= (x_1 + 0, x_2 + 0, x_3 + 0, x_4 + 0, x_5 + 0) \\
 &= (x_1, x_2, x_3, x_4, x_5) \\
 &= x
 \end{aligned}$$

Therefore, $x + 0 = x$ for all x

Step-5

4.

$$\begin{aligned}
 x + (-x) &= (x_1 + (-x_1), x_2 + (-x_2), x_3 + (-x_3), x_4 + (-x_4), x_5 + (-x_5)) \\
 &= (0, 0, 0, 0, 0) \\
 &= 0
 \end{aligned}$$

Therefore, $x + (-x) = 0$

5.

$$\begin{aligned}
 1x &= 1(x_1, x_2, x_3, x_4, x_5) \\
 &= (1x_1, 1x_2, 1x_3, 1x_4, 1x_5) \\
 &= (x_1, x_2, x_3, x_4, x_5) \\
 &= x
 \end{aligned}$$

Step-6

6. Let c_1, c_2 be any scalars.

Then

$$\begin{aligned}
 (c_1 c_2)x &= (c_1 c_2 x_1, c_1 c_2 x_2, c_1 c_2 x_3, c_1 c_2 x_4, c_1 c_2 x_5) \\
 &= c_1 (c_2 x_1, c_2 x_2, c_2 x_3, c_2 x_4, c_2 x_5) \\
 &= c_1 (c_2 (x_1, x_2, x_3, x_4, x_5)) \\
 &= c_1 (c_2 x)
 \end{aligned}$$

Step-7

7. Let c be any scalar

$$\begin{aligned}
c(x+y) &= c(x_1+y_1, x_2+y_2, x_3+y_3, x_4+y_4, x_5+y_5) \\
&= (cx_1+cy_1, cx_2+cy_2, cx_3+cy_3, cx_4+cy_4, cx_5+cy_5) \\
&= (cx_1, cx_2, cx_3, cx_4, cx_5) + (cy_1, cy_2, cy_3, cy_4, cy_5) \\
&= cx+cy
\end{aligned}$$

8. Let c_1, c_2 be any scalars.

$$\begin{aligned}
(c_1+c_2)x &= (c_1+c_2)(x_1, x_2, x_3, x_4, x_5) \\
&= ((c_1+c_2)x_1, (c_1+c_2)x_2, (c_1+c_2)x_3, (c_1+c_2)x_4, (c_1+c_2)x_5) \\
&= (c_1x_1+c_2x_1, c_1x_2+c_2x_2, c_1x_3+c_2x_3, c_1x_4+c_2x_4, c_1x_5+c_2x_5) \\
&= (c_1x_1, c_1x_2, c_1x_3, c_1x_4, c_1x_5) + (c_2x_1, c_2x_2, c_2x_3, c_2x_4, c_2x_5) \\
&= c_1x+c_2x
\end{aligned}$$

Step-8

Therefore all the four properties are satisfied

Therefore \mathbf{R}^5 is a vector space

Now let S, T are subspace of \mathbf{R}^5

$$\begin{aligned}
&x, y \in S \cap T \\
\Rightarrow x, y \in S, \quad x, y \in T \\
\Rightarrow x+y \in S, \quad x+y \in T \quad (\text{since } S, T \text{ are subspace of } \mathbf{R}^5) \\
\Rightarrow x+y \in S \cap T
\end{aligned}$$

Step-9

Let

$$\begin{aligned}
&x \in S \cap T \text{ and } r \in \mathbf{R} \\
&x \in S \text{ and } x \in T \text{ and } r \in \mathbf{R} \\
\Rightarrow rx \in S, rx \in T \quad (\text{since } S, T \text{ are subspace of } \mathbf{R}^5) \\
\Rightarrow rx \in S \cap T
\end{aligned}$$

Therefore, $S \cap T$ is a subspace of \mathbf{R}^5
