

## Step-1

Suppose  $B$  is an invertible matrix, then we have  $BB^{-1} = I$

We follow that the diagonal entries of the identity matrix are 1 and all other are zero.

The entry in the product matrix  $x_{ij}$  is obtained from the sum of the products of the entries of  $i^{\text{th}}$  row of  $B$  and  $j^{\text{th}}$  column of  $B^{-1}$

Further, the diagonal entries are formed by multiplying the  $i^{\text{th}}$  row of  $B$  and  $i^{\text{th}}$  column of  $B^{-1}$

The entries away from the principal diagonal are formed by multiplying the  $i^{\text{th}}$  row of  $B$  and  $j^{\text{th}}$  column of  $B^{-1}$

While are these entries are zero, we follow that  $i^{\text{th}}$  row of  $B$  and  $j^{\text{th}}$  column of  $B^{-1}$  are orthogonal when  $1 \leq i \neq j \leq n$
