

## Step-1

Given that the distance from a plane  $a^T x = c$  to the origin is  $\frac{|c|}{\|a\|}$

We have to find the distance from the origin to the plane  $x_1 + x_2 - x_3 - x_4 = 8$ , and we have to find the nearest point on the plane from the origin.

## Step-2

Given plane is  $x_1 + x_2 - x_3 - x_4 = 8$ , where  $c = 8$

$$\|a\| = \sqrt{1^2 + 1^2 + (-1)^2 + (-1)^2} = 2$$

The distance from a given plane to the origin

$$\begin{aligned} & \frac{|c|}{\|a\|} \\ &= \frac{8}{2} \\ &= \boxed{4} \end{aligned}$$

## Step-3

Let  $L$  = Distance from the point  $(0, 0, 0, 0)$  to the point  $(x, y, z, w)$  on the plane.

$$\hat{A} = \sqrt{x^2 + y^2 + z^2 + w^2}$$

Let  $f = L^2 = x^2 + y^2 + z^2 + w^2$

Given plane  $\phi(x, y, z, w) \equiv x + y - z - w - 8 = 0$

By Lagrange's multipliers,  $F = f + \lambda \phi$

## Step-4

$$F = x^2 + y^2 + z^2 + w^2 + \lambda(x + y - z - w - 8)$$

$$\frac{\partial F}{\partial x} = 0$$

$$\Rightarrow 2x + \lambda = 0$$

$$\Rightarrow x = -\frac{\lambda}{2}$$

### Step-5

$$\frac{\partial F}{\partial y} = 0$$

$$\Rightarrow 2y + \lambda = 0$$

$$\Rightarrow y = -\frac{\lambda}{2}$$

### Step-6

$$\frac{\partial F}{\partial z} = 0$$

$$\Rightarrow 2z - \lambda = 0$$

$$\Rightarrow z = \frac{\lambda}{2}$$

### Step-7

$$\frac{\partial F}{\partial w} = 0$$

$$\Rightarrow 2w - \lambda = 0$$

$$\Rightarrow w = \frac{\lambda}{2}$$

### Step-8

Now substitute the values of  $x, y, z, w$  in  $\phi$ , we get

$$\frac{-\lambda}{2} + \frac{-\lambda}{2} - \frac{\lambda}{2} - \frac{\lambda}{2} = 8$$

$$\Rightarrow -2\lambda = 8$$

$$\Rightarrow \lambda = -4$$

### Step-9

Therefore

$$\begin{aligned}x &= y \\&= \frac{-\lambda}{2} \\&= 2\end{aligned}$$

## Step-10

And

$$\begin{aligned}z &= w \\&= \frac{\lambda}{2} \\&= -2\end{aligned}$$

Hence required closest point =  $\boxed{(2, 2, -2, -2)}$
