

Step-1

We have to show that the best least-squares fit to a set of measurements y_1, \dots, y_m by a horizontal line is their average $C = \frac{y_1 + \dots + y_m}{m}$.

Step-2

First we write the equations that would hold if a line could go through m points.

Then every C would agree exactly with b ,

$Ax = b$ is

$$C = y_1$$

$$C = y_2$$

.

.

.

$$C = y_m$$

Step-3

The matrix form of the above system is

$$\begin{bmatrix} 1 \\ 1 \\ 1 \\ \vdots \\ \vdots \\ \vdots \\ 1 \end{bmatrix} [C] = \begin{bmatrix} y_1 \\ y_2 \\ y_3 \\ \vdots \\ \vdots \\ \vdots \\ y_m \end{bmatrix}$$

$$\text{Let } A = \begin{bmatrix} 1 \\ 1 \\ 1 \\ \vdots \\ \vdots \\ \vdots \\ 1 \end{bmatrix}, x = [C] \text{ and } b = \begin{bmatrix} y_1 \\ y_2 \\ y_3 \\ \vdots \\ \vdots \\ \vdots \\ y_m \end{bmatrix}$$

Step-4

We know that the least-squares best fit is given by

$$A^T A \hat{x} = A^T b$$

$$\Rightarrow \begin{bmatrix} 1 \\ 1 \\ 1 \\ \vdots \\ 1 \end{bmatrix} \cdot \begin{bmatrix} \bar{C} \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 1 \\ \vdots \\ 1 \end{bmatrix} \cdot \begin{bmatrix} y_1 \\ y_2 \\ y_3 \\ \vdots \\ y_m \end{bmatrix}$$

$$\Rightarrow [1 + 1 + \dots (m \text{ times})] \bar{C} = [y_1 + y_2 + \dots + y_m]$$

$$\Rightarrow (m \cdot 1) \bar{C} = y_1 + y_2 + \dots + y_m$$

$$\Rightarrow \bar{C} = \frac{y_1 + y_2 + \dots + y_m}{m}$$

Hence $\boxed{C = \frac{y_1 + y_2 + \dots + y_m}{m}}$ is the average of the measurements y_1, y_2, \dots, y_m .
