

Step-1

Consider the matrix equation $Ax = b$.

From the values of b and t , we can write

$$\begin{bmatrix} 1 & 2 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} C \\ D \end{bmatrix} = \begin{bmatrix} 0 \\ 16 \end{bmatrix}$$

Here,

$$A = \begin{bmatrix} 1 & 2 \\ 1 & 2 \end{bmatrix}$$

$$x = \begin{bmatrix} C \\ D \end{bmatrix}$$

$$b = \begin{bmatrix} 0 \\ 16 \end{bmatrix}$$

Step-2

Therefore, $A^T = \begin{bmatrix} 1 & 1 \\ 2 & 2 \end{bmatrix}$.

Thus,

$$\begin{aligned} A^T A &= \begin{bmatrix} 1 & 2 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 2 & 2 \end{bmatrix} \\ &= \begin{bmatrix} 2 & 4 \\ 4 & 8 \end{bmatrix} \end{aligned}$$

Step-3

The rank of $A^T A = \begin{bmatrix} 2 & 4 \\ 4 & 8 \end{bmatrix}$ is one and therefore, $(A^T A)^{-1}$ does not exist.

Thus, the normal equations break down in this case.

Step-4

We have,

$$\begin{aligned}
E^2 &= (b_1 - C - Dt_1)^2 + (b_2 - C - Dt_2)^2 \\
&= (0 - C - 2D)^2 + (6 - C - 2D)^2 \\
&= C^2 + 4CD + 4D^2 + 36 + C^2 + 4D^2 - 12C - 24D + 4CD \\
&= 2C^2 + 8CD + 8D^2 + 36 - 12C - 24D
\end{aligned}$$

Step-5

In order to minimize E^2 , differentiate it with respect to C and D .

$$\begin{aligned}
\frac{\partial E^2}{\partial C} &= 4C + 8D - 12 \\
\frac{\partial E^2}{\partial D} &= 8C + 16D - 24
\end{aligned}$$

Equating these two equations to zero, we get

$$C + 2D = 3.$$

The minimum value of $E^2 = 2C^2 + 8CD + 8D^2 + 36 - 12C - 24D$ occurs when $C = 1$ and $D = 1$.

Step-6

The optimal line has the equation: $\boxed{b = 1 + t}$.

The graph of the line is as drawn below:
